Chewing Ice—Your Teeth Feel Every Bite

Chewing Ice May Be a Refreshing Habit, But It Can Be Risky to Your Teeth!
Are you an ice chewer? For whatever reason you’re satisfied by the cool crunch of ice, it can seriously damage your teeth.

They Weren’t Built for It!
Your teeth are designed to last you a lifetime with proper care, but they were made for food only. Chewing ice, a habit your teeth were not built for, can cause a host of problems to your teeth. Fracture lines, cracking and chipping can all occur, which can make the teeth more sensitive and lead to further damage. In addition to your natural teeth, any dental work you may have is also subject to chipping and cracking that can lead to pain and costly repairs.

Ice chewing has also been linked to cases of anemia. If you find yourself constantly chewing ice, check with your physician to make sure there isn’t an underlying reason for your habit.

If You Must…
In the meantime, if you must have something to chew on, dentists recommend sticking to sugarfree gum. And leave the ice in the ice machine!

Help the environment…
Sign up for paperless EOBs!
If all eligible United Concordia Dental EOBs were delivered electronically each year, the environmental impact would equate to saving 162 tons of wood or 1,121 trees, conserving enough energy to power 20 homes for a year and reducing wastewater by 890,764 gallons.*

Visit UnitedConcordia.com and sign in to My Dental Benefits to enroll for paperless EOBs today!
